

# 7/25 ME132 Simulink!

Larry Hui

# Simulink® - Introduction

- Graphical front-end to MATLAB®
- Programming environment for dynamic system modeling, control design, simulation, and analysis.
  - used in industry so you should learn how to use it!
- Hierarchical block diagrams
  - How a model is organized
  - How parts interact
- Automatic code generation for embedded deployment

For documentation, click on this [link](#)!

# Simulink® - Configuration (Optional)

- “Simulation” → “Model Configuration Parameters”
  - “Solver” menu
    - Set “Solver Options” → “Type” to Variable-step
    - Set “Additional Options” → “Max Step Size” to 2e-3, to ensure sufficient resolution of simulation data
  - “Data Input/Export” menu
    - Set “Save to workspace” → “Format” to Array
    - Uncheck “Additional parameters Save options” → “Limit data points to last: ” to allow Simulink® to record as many data points as necessary
- Again, this is **optional**. You do not need to do this!
- “File” → “Simulink Preferences” → “Configuration Defaults”

# Simulink® - Component Blocks

- All components are listed in the library browser! Here are some common blocks

## 1. Continuous

Derivative

Numerical derivative of a signal

Integrator

Continuous-time integration of a signal

State-Space

Add a system block in state-space form

Transfer Fcn

Add a system block in transfer function form

## 2. Discontinuous

Limit input signal to specific upper and lower saturation values

# Simulink® - Component Blocks

## 3. Math Operations

Absolute value

Constant gain. Can do matrix multiplication by changing the type to "Matrix ( $K*u$ )"

Math functions such as exp, log, etc. Can choose from Function drop-down menu

Add/substruct two or more signals. Can change signs or add/remove input nodes

Used to place non-linear trig elements such as sin, cos, tan, and their inverse

# Simulink® - Component Blocks

## 4. Ports and Subsystems

Add an input to a subsystem

Add an output to a subsystem

Create a user-defined subsystem with variable number of inputs and outputs.

## 5. Signal Routing

Split up a bus of multiple signals into its individual signals

Combine multiple signals into a single bus

2<sup>nd</sup> input is compared against threshold and passes either 1<sup>st</sup> input or 3<sup>rd</sup> input.

# Simulink® - Component Blocks

## 6. Sinks/Output Visualization

Scope

View system signals during simulation. Can plot multiple signals at once

To Workspace

Store signals into MATLAB workspace as specified variable name

## 7. Sources

Clock

Clock signal returns time values used in simulation

Constant

Constant

Pulse

Periodic pulse signal

Ramp

Sine Wave

Step

Ramp/Sine wave/Step signal with specified parameters

# Simulink® - Example 1 (Output)

• **Sine to Scope**

stepSignal

To Workspace

Ready 100% VariableStepAuto

Block Parameters: Sine Wave

Sine Wave

Output a sine wave:

$$O(t) = \text{Amp} * \sin(\text{Freq} * t + \text{Phase}) + \text{Bias}$$

Sine type determines the computational technique used. The parameters in the two types are related through:

Samples per period =  $2 * \pi / (\text{Frequency} * \text{Sample time})$

Number of offset samples =  $\text{Phase} * \text{Samples per period} / (2 * \pi)$

Use the sample-based sine type if numerical problems due to running for large times (e.g. overflow in absolute time) occur.

Parameters

Sine type: Time based

Time (t): Use simulation time

Amplitude:

Amp

Bias:

Bias

Frequency (rad/sec):

2

Phase (rad):

0

Sample time:

variable stepSignal in workspace

```
Amp = 1;
Bias = 1;
sim('ME132Lab1.slx')
```

# Simulink® - Example 2 (Block Diagrams)

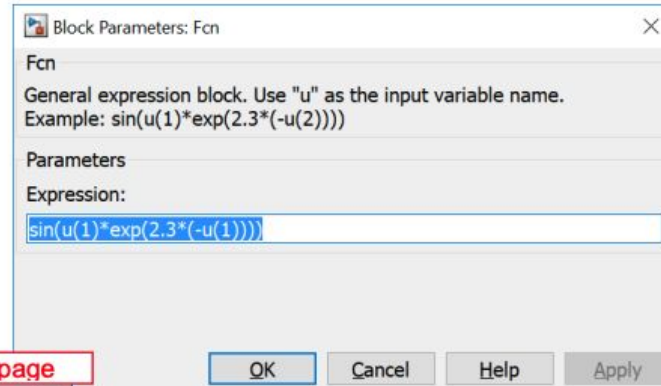

## 1. Math Operations: Gain, Summing Junction

## 2. Continuous: Integrator

# Simulink® - Example 3 (User-Defined Function)

change Max step size

see Simulink - configuration page

# Simulink® - Walkthrough

- Since most people have not been exposed to Simulink®, I'll be going over some examples in this video.
  - Basic sine wave gain, Spring-Mass Damper w MATLAB script, PID Control
- We will model a spring-mass damper and seeing it's response
- Video will be posted under the Discussion Summer 2025 > Larry's Discussion > Simulink Supplement

# Simulink® - Spring-Damper Setup

## Spring - Damper - Mass System

$$f(t) = u(t) = 1, \quad t \geq 0$$

$f_v, k, M$  are all unity  $\Rightarrow$  all 1!

### FBD

$$\sum F = M\ddot{x}$$

$$f(t) - kx - f_v\dot{x} = M\ddot{x}$$

$$M\ddot{x} + f_v\dot{x} + kx = f(t)$$

EOM!

$$\ddot{x} = \frac{1}{M} (f(t) - f_v\dot{x} - kx)$$

integrate twice

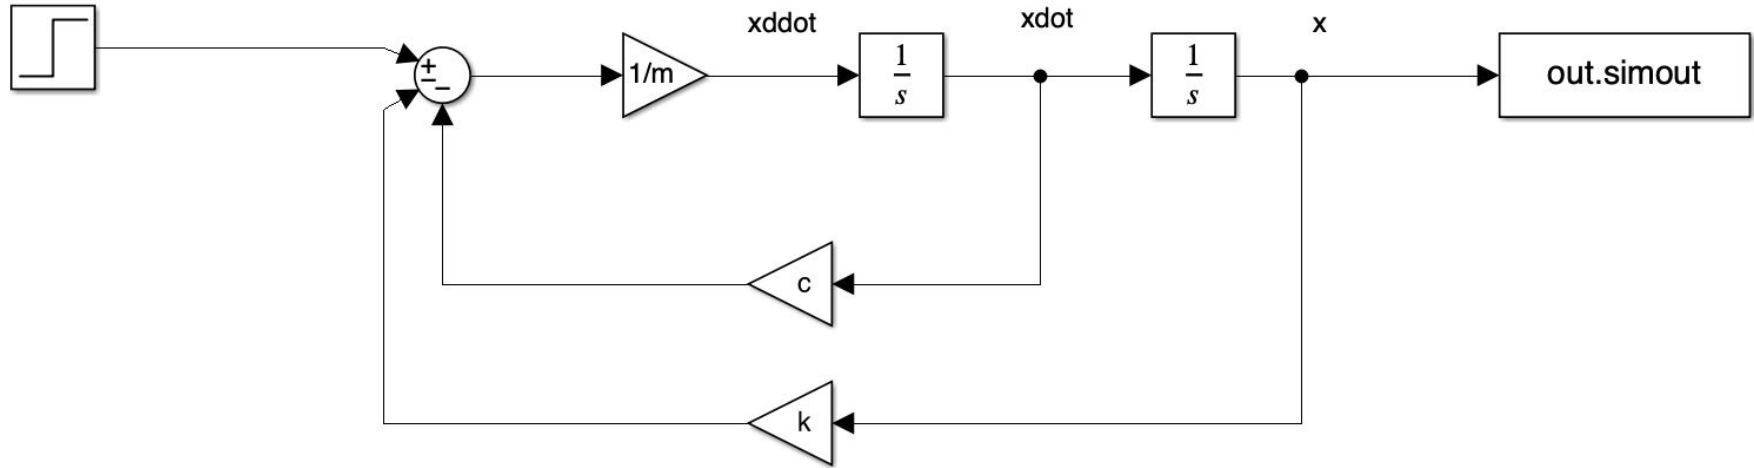

$$\iint \ddot{x} = \frac{1}{M} (\iint f(t) - \int \int f_v\dot{x} - \int \int kx)$$

$$x = \frac{1}{M} (\iint f(t) - kx - \int f_v\dot{x})$$

$\uparrow$  output  
 $\uparrow$  gain for feedforward path  
 $\uparrow$  input

# Simulink® - Spring-Damper Block Diagram

test.slx

# Simulink® - Spring-Damper Block Diagram Code

```
%% Open Loop control
clear, close all, clc

% initialize our variables
m = 1; c = 1; k = 1.1;

% configure simulation
smd_var = sim('test.slx');

% plot system response
plot(smd_var.simout.Time, smd_var.simout.Data, 'r', 'LineWidth', 1.5);
hold on
yline(1, '--')
```
